

BONTARDI PISKADÓNAN DI KÓRSOU

From July to October 2022, many of you participated in our study. You answered questions about your fishing habits, catches, shark observations and fishery management. We would like to thank all fishers who participated and share our results with you.

Through your knowledge we scientifically uncovered what you have known for generations: Sharks were more easily found around Curaçao in the past.

YOUR TOP 3 FUTURE MANAGEMENT SUGGESTIONS:

- 1: More FADs
- 2: Manage pollution (especially near Hato)
- 3: Increase harbor maintenance & security (like Piscaderabaai)

YOUR MAIN CONCERNS ABOUT THE OCEAN'S HEALTH:

- 1: "Fish are less abundant"
- 2: "The sea is polluted"
- 3: "Fishing is our food and life"

WHAT'S NEXT?

1. Share your knowledge, ideas, concerns, and perspectives with local fishery management and policy makers to make a change.
2. Publish the results in a scientific journal

We will share more details and the publication throughout the year on a website you can access through the QR code. If you wish to receive a notifications when there is an update, have any concerns, questions or suggestions, please message us via the contact form on the website.
